

Core-level switches

Overview

A core switch is a high-capacity network switch that functions as a network's backbone or core layer. It's responsible for accurately routing communication among layers and departments of different sections. In a nutshell, it helps convey vast chunks of data at greater speeds. It is a powerful backbone switch in the center of the network core layer, which centralizes multiple aggregation switches to the core and implements LAN routing. Engineered to aggregate massive volumes of.
