

How to check the speed of the FC interface

AI Overview

You can check the speed of an FC interface using platform-specific commands such as `fc adapter show` on NetApp, `show interface fc` on Cisco MDS switches, or `display interface and speed` commands on Huawei devices. Checking FC Speed on NetApp

ONTAP On NetApp systems, you can use the `fc adapter show` command to display the status and speed of Fibre Channel adapters. For example, to view detailed information about adapter 0d on node1, including its speed, you can

run: `CodeCopy fc adapter show -v` This command provides the operational speed, target and initiator addresses, and other adapter details. If the port is set to autonegotiation, the speed may adjust automatically, but manual configuration is possible using the `fc adapter modify` command to set a specific speed, such as 2 Gbps .Checking FC Speed on Cisco MDS Switches For Cisco MDS switches, the `show interface fc` command displays the operational state and speed of a specific Fibre Channel interface. For example: `CodeCopy show interface fc1/1` This command provides detailed information including: Operational speed (e.g., 2G, 4G, 8G, 16G) Interface status (up/down) SFP module details (Tx/Rx power) Logged-in devices and WWPNs You can also use `show interface fc brief` for a summarized view of all FC ports .Checking FC Speed on Huawei Devices On Huawei FC interfaces, the `speed` command is used to set or display the interface rate in non-auto negotiation mode. To check the current speed: `CodeCopy display interface fc 1/0/1` This shows the operational speed and status. If the interface is in non-auto negotiation mode, you can explicitly set or verify the speed using: `CodeCopy speed {2000 | 4000 | 8000 | 16000}` depending on the module type. The `undo speed` command restores the default rate .Key Considerations Ensure the FC interface is connected to a compatibl...
