

Idu optical module

Overview

The integrated Optical Distribution Unit (iODU) receives downlink RF signals from the integrated BTS Interface Unit (iBIU), converts the RF signals to optical, then sends the signal to the remote optic units (ROUs) or to the Optic Expansion Unit (OEU or iOEU) via fiber optic cabling. The iBIU can be configured with any combination of point-of-interface (POI) modules: high power (20W), low power (100mW), or hybrid (high and low power). For. Band signals transition on long distances. Additionally, the Set ensures transmission of 10MHz reference signal and one or two Gigab ing, adjusted for IDU andVSAT systems provide remote connectivity using satellites, enabling voice and data services in areas where traditional communication infrastructure is lacking. These systems facilitate voice and data calls for remote users, utilizing various frequency bands like C band and Ku band depending on the. Global Foxcom's Iridium Optical Link by is a high-performance fiber optic solution designed to extend Iridium satellite connectivity deep into enclosed, underground, or isolated environments. By eliminating the need for a direct line of sight to the sky, it ensures uninterrupted, mission-critical.
