

Model and Specifications of Computer Room Power Distribution Box

AI Overview

Computer room power distribution boxes, or PDUs, come in basic, metered, monitored, and intelligent models, offering scalable, reliable, and remotely controllable power distribution for server racks and data centers. Overview of PDUs Power Distribution Units (PDUs) are specialized devices designed to distribute electrical power from a single input source to multiple output receptacles in data centers and server racks. Unlike standard power strips, PDUs are engineered for high-density IT environments, providing robust construction, precise power management, and monitoring capabilities to ensure reliable operation of critical equipment.

Common PDU Models and Types

- Basic PDUs** Provide foundational power distribution without monitoring capabilities. Focus on robust construction and dependable performance. Ideal for environments where cost-effective, simple power delivery is sufficient.
- Metered PDUs** Include local or remote metering to monitor power usage at the rack or input level. Help with load balancing and preventing overloads. Some models allow daisy-chaining multiple PDUs under a single IP address.
- Monitored PDUs** Offer real-time monitoring of power consumption at the rack or outlet level. Enable proactive management of energy usage and capacity planning. Often include LED displays for local monitoring.
- Switched or Intelligent PDUs** Provide remote on/off switching for individual outlets. Support scheduled power cycling, group reboot, and sequential socket switching. Allow full control and automation of power distribution, enhancing uptime and operational efficiency.

Technical Specifications

- Input Voltage:** Typically ranges from 120V to 415V AC, depending on the model and region.
- Current Capacity:** Models support from 16A up to 400A for high-capacity applications.
- Outlet Types:** IEC, NEMA, or universal outlets to accommodat...
