

Router fiber optic cable emits red light

AI Overview

A red light on your router typically indicates a loss of signal or connectivity issue, often caused by cable problems, service outages, or router malfunctions.

Common Causes

- Loss of Signal (LOS):** The red light often signals that your router cannot communicate with your ISP, which may be due to a damaged fiber optic cable, loose connections, or a service outage.
- Loose or Improperly Connected Cables:** If the fiber optic cable or Ethernet cable is not securely connected to the WAN/ONT port, the router may show a red light.
- Router or ONT Malfunction:** Hardware issues, firmware bugs, or overheating can trigger a red light.
- Power Fluctuations:** Inconsistent power supply can disrupt the router's operation and cause the red light to appear.
- ISP Service Outage:** Maintenance or local outages from your ISP can also result in a red light.

Troubleshooting Steps

- Check for ISP Outages:** Visit your ISP's website or social media pages to confirm if there is a known service disruption.
- Inspect the Fiber Optic Cable:** Look for physical damage, bends, or cuts. Ensure the cable is firmly connected to the WAN/ONT port.
- Restart the Router:** Power cycle the router by turning it off, waiting 30 seconds, and turning it back on. This clears temporary settings and cache.
- Verify Cable Connections:** Remove and reconnect all cables, ensuring they click securely into the correct ports. WAN ports are for internet input, while LAN ports connect to devices.
- Update Firmware:** Check your router's app or admin panel for pending firmware updates and install them to fix potential bugs.
- Reset the Router:** If the red light persists, perform a factory reset following the manufacturer's instructions. Note that this will erase custom settings.
- Contact ISP Support:** If none of the above steps resolve the issue, your ISP can check the connection remotely or replace faulty equipment.

Additional Tips

- Avoid bending the fiber optic cable sharply, as it can break the internal fibers.
- Ensure the router is placed in a well-ventilated area to prevent overheating.
- If using a mesh system, ensure the primary router is online...
