

Router fiber optic cable keeps flashing red

AI Overview

A red blinking light on your router's fiber optic connection indicates a Loss of Signal (LOS), meaning your router cannot communicate with your Internet Service Provider (ISP). Common Causes

Fiber Optic Cable Damage: Physical cuts, bends, or kinks in the fiber optic cable can disrupt the signal, preventing proper communication with your ISP.

Service Outage: ISP maintenance, technical issues, or local infrastructure problems can temporarily cut your internet service.

Loose or Damaged Connections: Improperly connected cables or worn connectors can cause signal loss.

Router or ONT Malfunction: A faulty router or Optical Network Terminal (ONT) may fail to detect the incoming signal.

Power Issues: Fluctuations or interruptions in power supply can affect router performance.

Troubleshooting Steps

Check for Local Outages: Visit your ISP's website or social media pages to see if there is a known service outage in your area.

Inspect the Fiber Optic Cable: Look for visible damage, bends, or cuts. Ensure the cable is securely connected to the router's WAN/ONT port.

Reboot Your Router: Turn off the router, unplug it from the power source for 30 seconds, then reconnect and power it on. This often resolves temporary signal issues.

Verify Cable Connections: Check that all cables, including power, LAN, and fiber optic, are firmly connected. Replace any damaged cables.

Check Router Settings and Firmware: Ensure your router's WAN settings are correct and update the firmware if needed.

Contact Your ISP: If the LOS light remains red after these steps, the issue may be outside your home, requiring a technician to inspect the fiber line.

Additional Tips

Avoid bending the fiber optic cable sharply; even small kinks can disrupt the signal. Keep the router in a well-ventilated area to prevent overheating. If pets or children are around, ensure cables are protected from chewing or accidental disconnection.
