

What to do if the KVM switch shows no signal

AI Overview

If your KVM switch is not receiving a signal, the issue is often related to power, cables, resolution settings, or EDID conflicts, and can usually be resolved through systematic troubleshooting.

Check Power and Connections Ensure the KVM switch is powered on and the power source is properly connected. Verify that the power indicator light is on and, if applicable, that the power switch is in the "On" position. Inspect all cables connecting the KVM to the monitors and computers to confirm they are securely connected and functioning properly. If necessary, try replacing the cables with high-quality alternatives to rule out cable faults.

Verify Input Source and Channel Confirm that the input source (computer or device) is powered on and that the KVM is switched to the correct channel corresponding to that source. Test the monitor and computer by connecting them directly, bypassing the KVM, to ensure the devices and cables are working correctly.

Adjust Resolution and Refresh Rate Some KVM switches have limitations on supported resolutions and refresh rates. If the monitor works when directly connected but not through the KVM, try lowering the output resolution (e.g., 720p or 1080p) and reconnecting. Check the KVM's specifications to ensure compatibility with your monitor's resolution and refresh rate.

Check Adapter and Port Compatibility For setups using USB-C, DisplayPort, or HDMI adapters, ensure the adapters are compatible and correctly oriented. DisplayPort to HDMI adapters, for example, only work in one direction. Mini DisplayPort connections may require active adapters to function properly. Verify that the KVM's video input matches the computer's output and that any adapters support the required video mode.

Address EDID and Signal Handshaking Issues Some KVM switches use pass-through EDID, which can cause the GPU to detect a monitor disconnect when switch...
